INDEX

CHAPTER 1

INTRODUCTION

Computer information technology is increasingly penetrating into the hospital domain. A major challenge involved in this process is to provide doctors with efficient, intuitive, accurate and safe means of interaction without affecting the quality of their work. Keyboards and pointing devices, such as a mouse, are today's principal method of human—computer interaction. However, the use of computer keyboards and mice by doctors and nurses in intensive care units (ICUs) is a common method for spreading infections. In this project, we suggest the use of hand gestures as an alternative to existing interface techniques, offering the major advantage of sterility. Even though voice control also provides sterility, the noise level in the operating room (OR) deems it problematic.

In this project, we refer to gestures as a basic form of non-verbal communication made with the hands. Psychological studies showed that young children use gestures to communicate before they learn to talk. Manipulation, as a form of gesticulation, is often used when people speak to each other about some object. Naturalness of expression, non-encumbered interaction, intuitiveness and high sterility are all good reasons to replace the current interface technology (e.g., keyboard, mouse, and joystick) with more natural interfaces.

1.1 Project Overview

Humans are able to recognize body and sign language easily. This is possible due to the combination of vision and synaptic interactions that were formed along brain development . In order to replicate this skill in computers, some problems need to be solved: how to separate objects of interest in images and which image capture technology and classification technique are more appropriate, among others.

In this project Gesture based Desktop automation, First the model is trained pre trained on the images of different hand gestures, such as a showing numbers with fingers as 1, 2, 3, 4 . This model uses the integrated webcam to capture the video frame. The image of the gesture captured in the video frame is compared with the Pre-trained model and the gesture is identified. If the gesture predicts is 1 then images is blurred; 2 image is resized; 3 image is rotated etc.

1.2 Purpose

Purpose of the project is used to browse the radiology images using hand gestures rather than using mouse, keyboard etc, to maintaining sterility inside the operation room.

CHAPTER 2

LITERATURE SURVEY

1. The recently developed depth sensors, e.g., the Kinect sensor, have provided new opportunities for human-computer interaction (HCI). Although great progress has been made by leveraging the Kinect sensor, e.g., in human body tracking, face recognition and human action recognition, robust hand gesture recognition remains an open problem. Compared to the entire human body, the hand is a smaller object with more complex articulations and more easily affected by segmentation errors. It is thus a very challenging problem to recognize hand gestures. This paper focuses on building a robust part-based hand gesture recognition system using Kinect sensor. To handle the noisy hand shapes obtained from the Kinect sensor, we propose a novel distance metric, Finger-Earth Mover's Distance (FEMD), to measure the dissimilarity between hand shapes. As it only matches the finger parts while not the whole hand, it can better distinguish the hand gestures of slight differences. The extensive experiments demonstrate that our hand gesture recognition system is accurate (a 93.2% mean accuracy on a challenging 10-gesture dataset), efficient (average 0.0750 s per frame), robust to hand articulations, distortions and orientation or scale changes, and can work in uncontrolled environments (cluttered backgrounds and lighting conditions). The superiority of our system is further demonstrated in two real-life HCI applications.

2. In this paper, we address natural human-robot interaction (HRI) in a smart assisted living (SAIL) system for the elderly and the disabled. Two common HRI problems are studied: hand gesture recognition and daily activity recognition. For hand gesture recognition, we implemented a neural network for gesture spotting and a hierarchical hidden Markov model for context-based recognition. For daily activity recognition, a multi sensor fusion scheme is developed to process motion data collected from the foot and the waist of a human subject. Experiments using a prototype wearable sensor system show the effectiveness and accuracy of our algorithms.

3. The use of doctor-computer interaction devices in the operation room (OR) requires new modalities that support medical imaging manipulation while allowing doctors' hands to remain sterile, supporting their focus of attention, and providing fast response times. This paper presents "*Gestix*," a vision-based hand gesture capture and recognition system that interprets in real-time the user's gestures for navigation and manipulation of images in an electronic medical record (EMR) database. Navigation and other gestures are translated to commands based on their temporal trajectories, through video capture. "*Gestix*" was tested during a brain biopsy procedure. In the in vivo experiment, this interface prevented

the surgeon's focus shift and change of location while achieving a rapid intuitive reaction and easy interaction. Data from two usability tests provide insights and implications regarding human-computer interaction based on nonverbal conversational modalities.

4. They have developed a system that uses computer vision to replace standard computer mouse functions with hand gestures. The system is designed to enable non-contact human-computer interaction (HCI), so that surgeons will be able to make more effective use of computers during surgery. In this paper, They begin by discussing the need for non-contact computer interfaces in the operating room. They then describe the design of our non-contact mouse system, focusing on the techniques used for hand detection, tracking, and gesture recognition. Finally, They present preliminary results from testing and planned future work.

5. A gesture interface is developed for users, such as doctors/surgeons, to browse medical images in a sterile medical environment. A vision-based gesture capture system interprets user's gestures in real-time to manipulate objects in an image visualization environment. A color distribution model of the gamut of colors of the users hand or glove is built at the start of each session resulting in an independent system. The gesture system relies on real-time robust tracking of the user's hand based on a color-motion fusion model, in which the relative weight applied to the motion and color cues are adaptively determined according to the state of the system. Dynamic navigation gestures are translated to commands based on their relative positions on the screen. A state machine switches between other gestures such as zoom and rotate, as well as a sleep state. Performance evaluation included gesture recognition accuracy, task learning, and rotation accuracy. Fast task learning rates were found with convergence after ten trials. A beta test of a system prototype was conducted during a live brain biopsy operation, where neurosurgeons were able to browse through MRI images of the patient's brain using the sterile hand gesture interface. The surgeons indicated the system was easy to use and fast with high overall satisfaction.

2.1 Existing problem

When the doctors inside the operation room use keyboard and mouse, there is a possibility of spreading infection. So, in this project we used hand gesture methodology to keep the doctor sterile.

2.3 Problem Statement Definition

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A doctor	Browse the radiology images inside the operation room	It's the highest chance to spread infection	Using the same hand for operation as well as to touch the keyboard, mouse, screen etc	Not sterile
PS-2	A doctor	Browse the radiology images inside the operation room	It affects the patient	Of the noice produced during the voice recognition	Annoying

CHAPTER 3

IDEATION & PROPOSED SOLUTION

3.1 Empathy Map Canvas

A GESTURE - BASED TOOL FOR STERILE BROWSING OF RADIOLOGY IMAGES

What do they
THINK AND FEEL?
what really counts
major preoccupations
worries & aspirations

Non-verbal communication | Fast response | IS it expensive ? | Inadequate

What do they
HEAR?
what friends say
what boss say
what influencers say

Efficient | Time management | Unsecure | Easily accessible

What do they
SEE?
environment
friends
what the market offers

Touchless interaction | Reliable | It can be used by all | Clear view

What do they
SAY AND DO?
attitude in public
appearance
behavior towards others

List pros/ cons | Ask for suggestion | Do more research | How fast it works?

PAIN
fears
frustrations
obstacles

Inaccuracy | Unknown structure of design | Problem in sensor | Responses can be slow

GAIN
"wants" / needs
measures of success
obstacles

Easy to use | Non-verbal interaction | Applicable to many fields | Advanced technology

3.2 Ideation & Brainstorming

Step-1: Team Gathering, Collaboration and Select the Problem Statement

Step-2: Brainstorm, Idea Listing and Grouping

A GESTURE - BASED TOOL FOR STERILE BROWSING OF RADIOLOGY IMAGES

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

⏱ 10 minutes

TIP
You can select a sticky note and hit the pencil [switch to sketch] icon to start drawing!

KENWINSHIKAA A P

- Collect dataset of hand gesture
- Train the radiology images with the dataset collected
- Use CNN to train the model
- Create a web page
- User can upload the image which the trained wants
- Test the model using the trained dataset
- Use OpenCV to capture frames
- The gesture captured in the frame is compared with the trained images

AKILESWARI R

- Download the dataset
- Use waterfall method for training
- Process the dataset
- Deploy the model
- Test the model by using the webcam

DIVYA C

- Get the dataset
- To train the selected dataset use deep learning algorithm
- Train the model
- Make a web application
- Upload the images on the web
- Test it by showing the hand gesture 1,2,3 etc

JEYA VAISHNAVI M

- Dataset collection
- Use transfer learning algorithm
- pre-process the dataset
- Use the algorithm to train the model with the required dataset
- Test the model using OpenCV
- Use integrated webcam to capture video frames
- Quick response with accurate result will be provided

3

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go.
In the last 10 minutes, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you and break it up into smaller sub-groups.

⏱ 20 minutes

DATASET :

- Collect dataset of hand gesture
- Download the dataset
- Get the dataset
- Dataset collection

TIP
Add customizable tags to sticky notes to make it easier to find, browse, organize, and categorize important ideas as themes within your mural.

METHODS TO BE USED :

- Use CNN to train the model
- Use waterfall method for training
- To train the selected dataset use deep learning algorithm
- Use transfer learning algorithm

TRAINING PHASE :

- Process the dataset
- Train the model
- Use the algorithm to train the model with the required dataset

TESTING PHASE :

- Test the model by using the webcam
- Test the model using the trained dataset
- Test the model using OpenCV

OTHERS :

- Quick response with accurate result will be provided
- Deploy the model
- pre-process the dataset

APPLICATION TO BE USED :

- Use OpenCV to capture frames
- Upload the images on the web
- The gesture captured in the frame is compared with the trained images
- Use integrated webcam to capture video frames
- Make a web application

Step-3: Idea Prioritization

4

Prioritize

Your team should all be on the same page about what's important moving
forward. Place your ideas on this grid to determine which ideas are important and
which are feasible.

🕐 **20 minutes**

Importance

If each of these
tasks could get
done without any
difficulty or cost,
which would have
the most positive
impact?

- Collect dataset of hand geature
- User can upload the image which he wants
- Make a web application
- The gesture captured in the frame is compared with the trained images
- pre-process the dataset
- Test it by showing the hand gesture 1, 2, 3 etc
- Use CNN to train the model
- Use integrated webcam to capture video frames
- To train the collected dataset use deep learning algorithm
- Deploy the model
- Quick response with accurate result will be provided
- Use transfer learning algorithm
- Use waterfall method for training
- Get the dataset
- Test the model using the trained dataset
- Test the model by using the webcam

TIP 💡

Participants can use their
cursors to point at where
sticky notes should go on
the grid. The facilitator can
confirm the spot by using
the laser pointer holding the
H key on the keyboard.

- Test the model using OpenCV
- Test the model using the trained dataset

Feasibility

Regardless of their importance, which tasks are more
feasible than others? (Cost, time, effort, complexity, etc.)

8

3.3 Proposed Solution

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Interaction between doctor-computer inside the operation room. Keyboard and pointing devices such as mouse are today's method of human-computer interaction. However, the use of computer keyboard and mouse by doctors and nurses in intensive care units is a common method of spreading infections.
2.	Idea / Solution description	In this project, we use hand gestures as an alternative to existing interface techniques, offering the major advantage of sterility.
3.	Novelty / Uniqueness	We are using Convolutional Neural Network to first train the model on the images of different hand gestures, like showing numbers with fingers as 0,1,2,3,4,5. Then we made a web portal using Flask where user can input any image on which one wants to perform the operations. After uploading the image, our portal uses the integrated webcam to capture the video frame using OpenCV. The gesture captured in the video frame is compared with the Pre-trained model and the gesture is identified. If the prediction is 0 - then images is converted into rectangle, 1 - image is Resized into (200,200), 2 - image is rotated by -45°, 3 - image is blurred , 4 - image is Resized into (400,400) , 5 - image is converted into gray scale.
4.	Social Impact / Customer Satisfaction	Contributing the corporate social responsibility by providing better solutions to the healthcare and to patients.
5.	Business Model (Revenue Model)	Can collaborate with diagnosis centers and hospitals. It can also collaborate with government health awareness camps.
6.	Scalability of the Solution	The use of doctor-computer interaction devices in the operation room supports medical imaging manipulation while allowing doctors' hands to remain sterile, supporting their focus of attention, and providing fast response times.

3.4 Problem Solution fit

Define CS,	**1. CUSTOMER SEGMENT(S)** `CS` Hospital domain, especially used for doctors inside the operation room.	**6. CUSTOMER CONSTRAINTS** `CC` No breakdown of power and full internet access.	**5. AVAILABLE SOLUTIONS** `AS` Doctors use their hands to access the computer to zoom, scroll, rotate etc of radiology images by touching keyboard, mouse and screen.	**Explore AS,**
Focus on J&P, tap into BE,	**2. JOBS-TO-BE-DONE/PROBLEMS** `J&P` To keep the doctor sterile inside the operation room.	**9. PROBLEM ROOT CAUSE** `RC` Doctors use their hands to access the computer by touching keyboard, mouse and screen to scroll, zoom, rotate the radiology images and this may lead to the spreading of infections inside the operation room.	**7. BEHAVIOUR** `BE` Directly related : Easy to use, can predict the hand gesture correctly and accurately. Indirectly associated : Require high internetspeed.	**Focus on J&P, tap into BE,**
Identify strong TR & EM	**3. TRIGGERS** `TR` If the operation is done and successfully completed by using this project in an hospital, that makes other hospital to use. **4. EMOTIONS: BEFORE / AFTER** `EM` Before: Spreading of infection. After: Faster response, avoid spreading of infection.	**10. YOUR SOLUTION** `SL` 1) Create a webpage to upload the images which needs in operation room. 2) It consumes less data and secures the information of the radiology images. 3) OpenCV is used to recognize the hand gestures that is used by the doctors. 4) Accurate result will be provided.	**8. CHANNELS of BEHAVIOUR** `CH` Online: To upload the radiology images in the created webpage. Offline: Stores the result of the radiology images.	**Extract online & offline CH of BE**

CHAPTER 4

REQUIREMENT ANALYSIS

4.1 Functional Requirements

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Link (HTML page)
FR-2	User Confirmation	Confirmation via Email
FR-3	Upload images as input	Add image through Device or through Drive
FR-4	Camera on	When the camera is on it recognize the hand gesturesand return the required output.

4.2 Non-functional Requirements

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	This software will be easy to use for all users with minimal instructions. 100% of the languages on the graphical user interface (GUI) shall be intuitive and understandable by non-technical users.
NFR-2	Security	The user of the system should be provided the surety that their account details are secure. The system will provide security against cross siterequest forgery.
NFR-3	Reliability	This software will be operable in all lighting conditions. Regardless of the brightness level in user's operating environment, the program shall always detect user's hands.
NFR-4	Performance	This software will minimize the number of calculations needed to perform image processingand hand gesture detection. Each captured videoframe shall be processed fast.
NFR-5	Availability	This software will be available to all operating system. While it is currently has a relatively limitedrole in direct patient care, its evolving role in complex clinical decision making is foreseeable.
NFR-6	Scalability	This software will be enterprise scalability of AI development and deployment.

PROJECT DESIGN

5.1 Data flow diagams

Example: DFD Level 0 (A Gesture-based Tool for Sterile Browsing of Radiology Images)
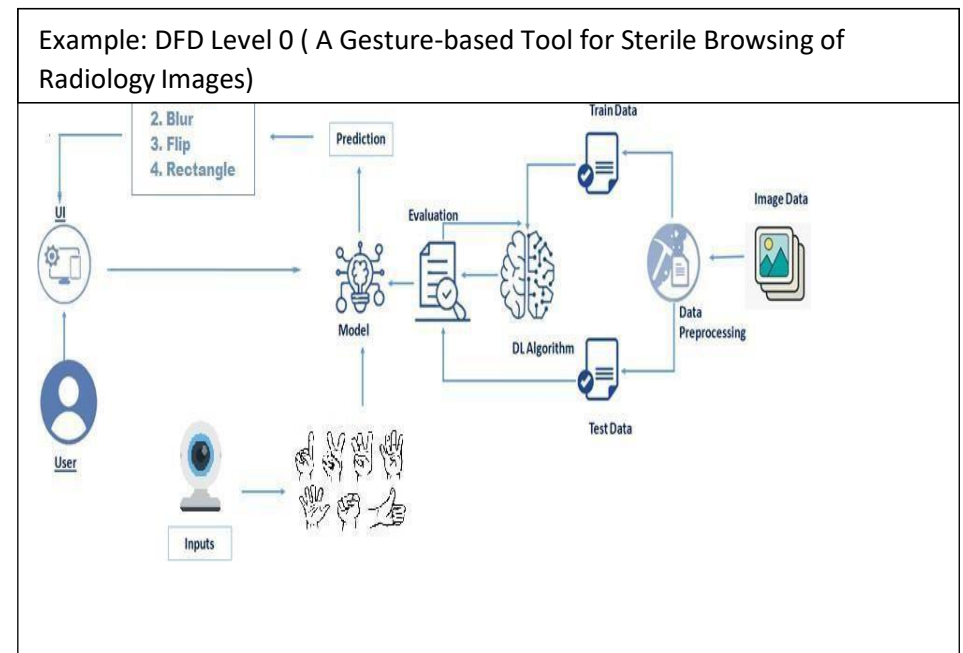

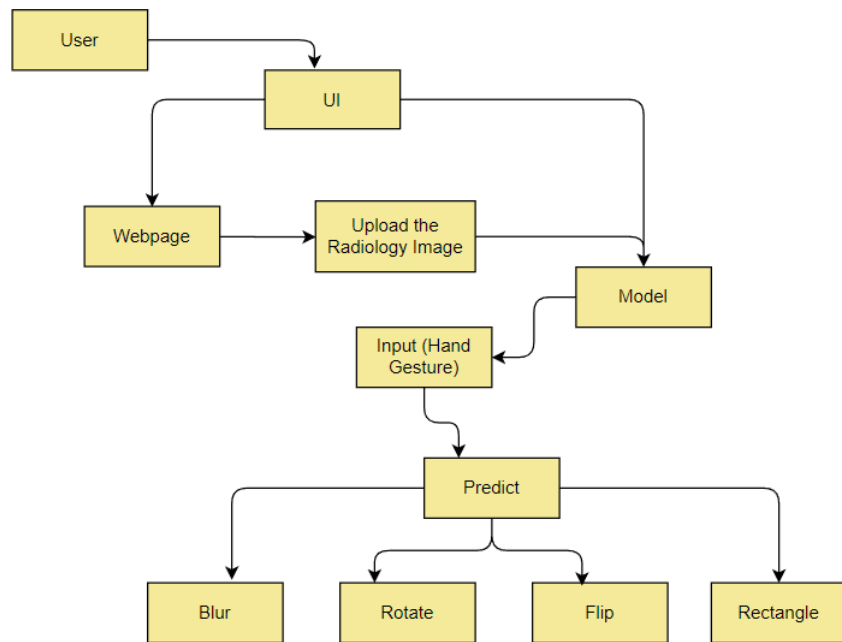

5.2 Solution Architecture

1.	Resize	
2.	Blur	
3.	Flip	

Prediction

Train data

Flask

User interface

Model

Evaluation

Deep learning
algorithm

Data processing

Test data

Image data
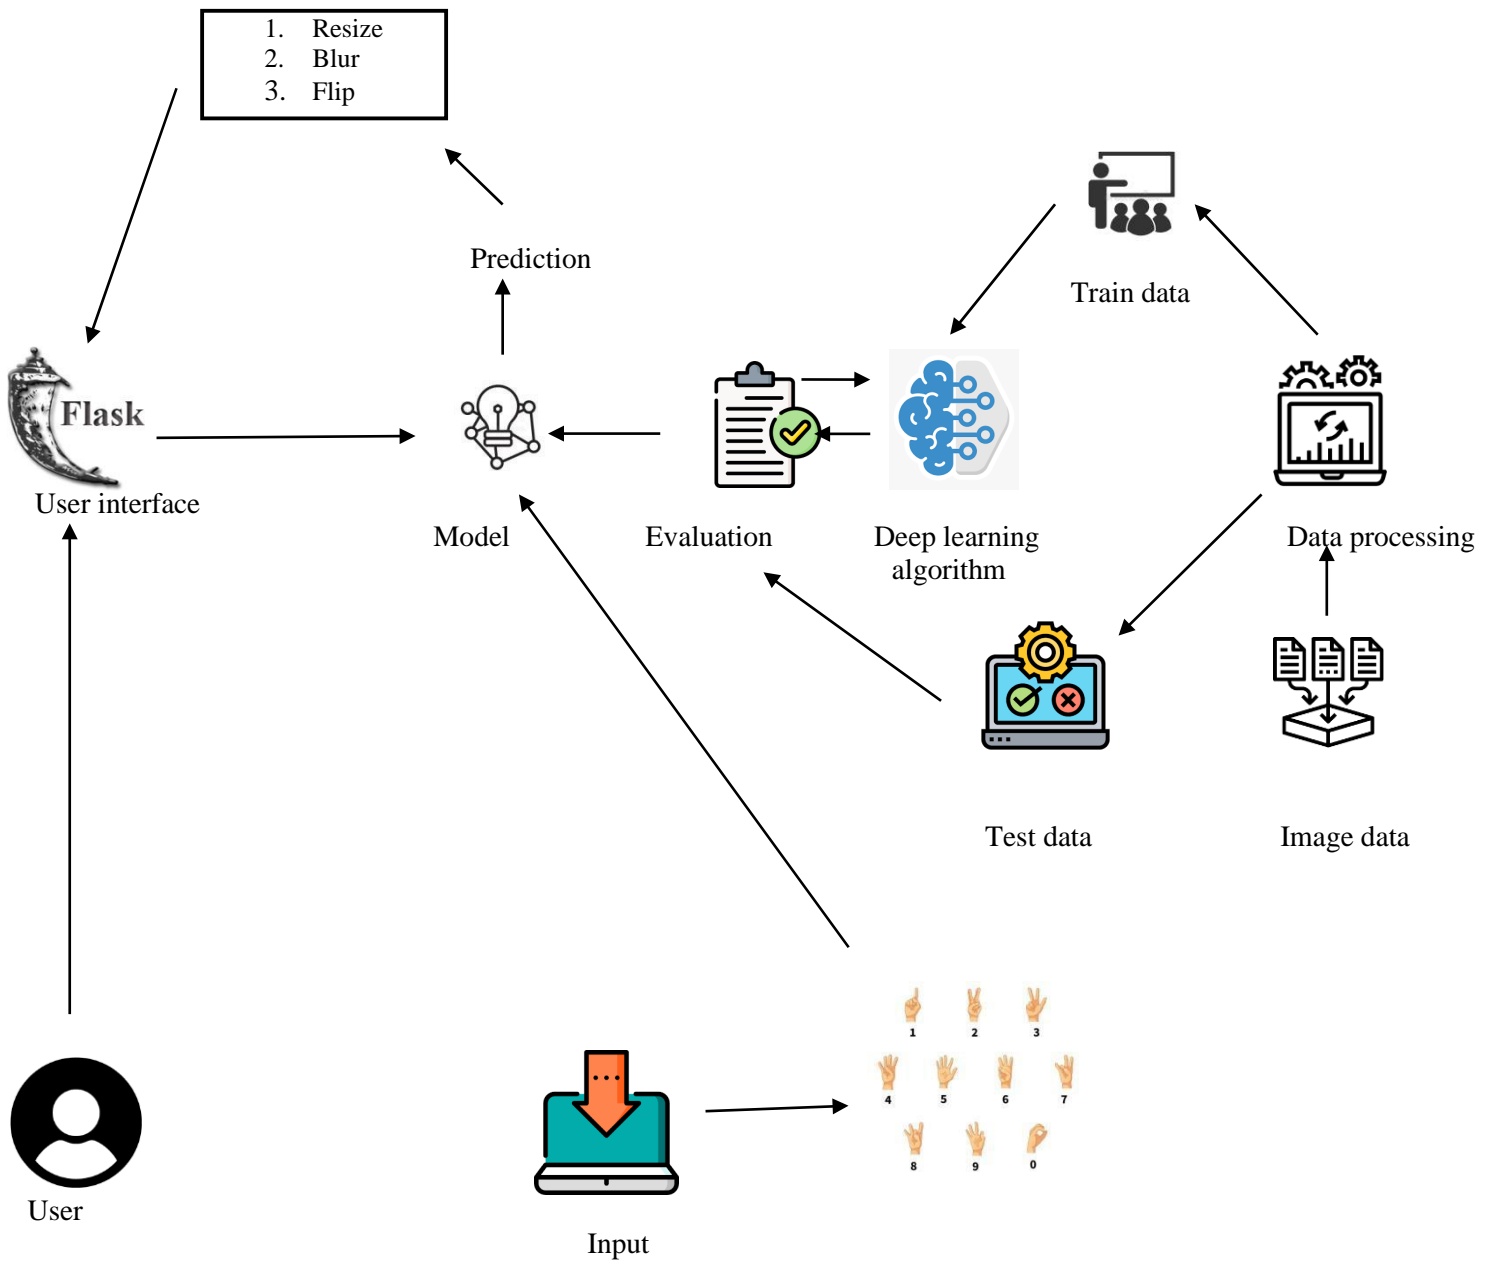

User

Input

Technical Architecture
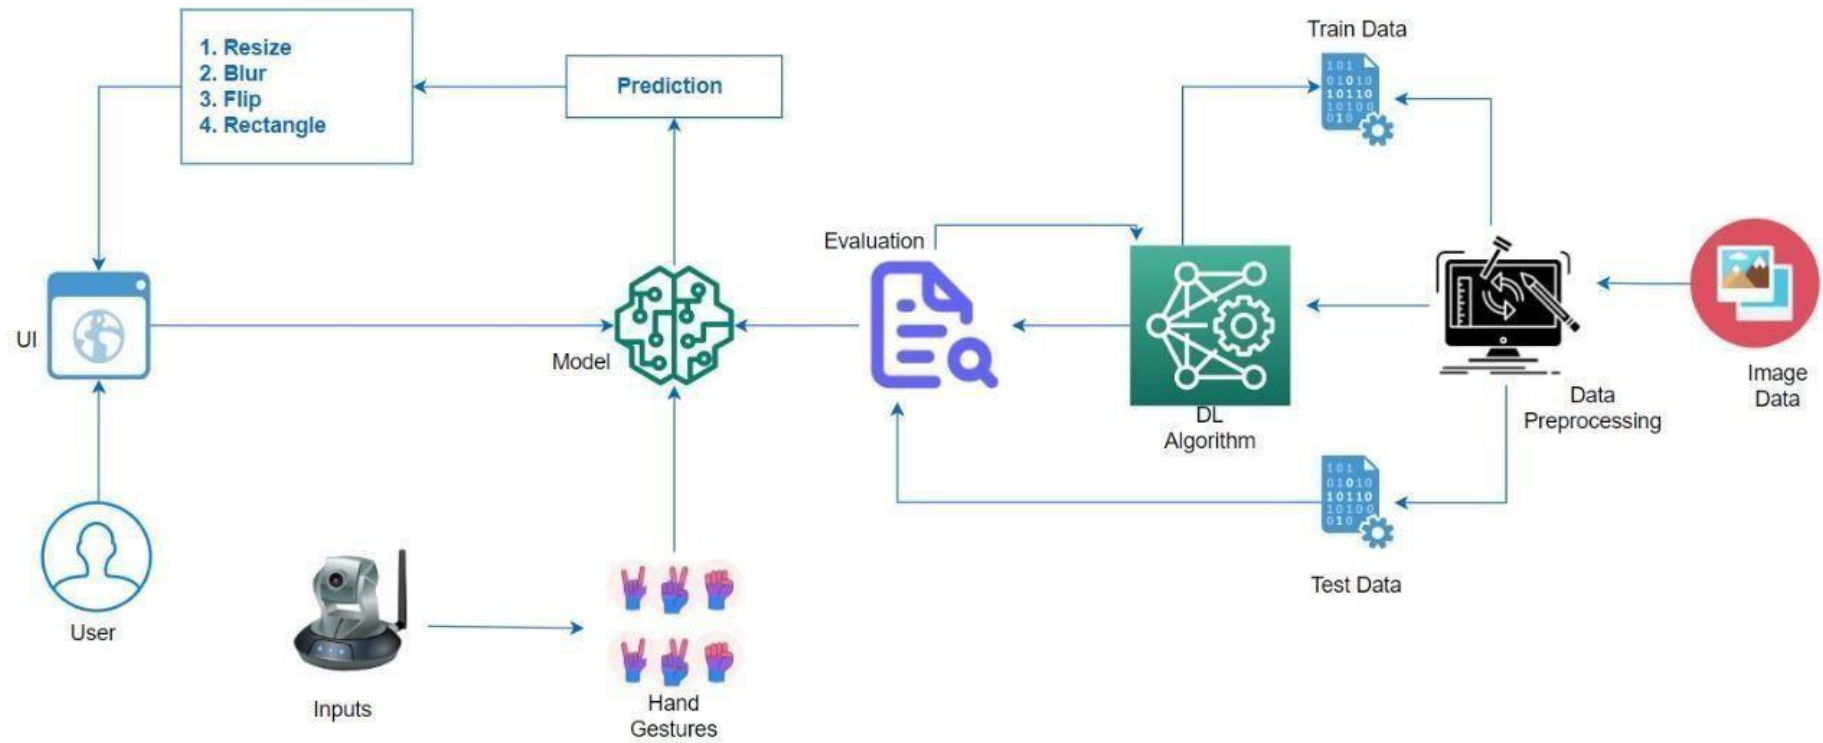

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	UI (Web)	HTML, CSS, JavaScript.
2.	Application Logic-1 Image Pre-processing	Input image is pre-processed with the help of library files.	Python, TensorFlow
3.	Application Logic-2Building Model	Building CNN model to recognize the gesture.	Python, Keras
4.	Application Logic-3Creation of app	App is built to obtain gesture as input and to provide as output.	HTML, CSS, JavaScript
5.	Dataset	Hand gesture data set.	From IBM
6.	Cloud Database	User input image is stored in cloud.	IBM Cloud
7.	File Storage	File storage contains dataset and source code.	Device or Drive
8.	Machine Learning Model	CNN Model was used to recognize the pre-processed image by image capturing or by video segmenting.	CNN Model by Python, Keras

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	Application development, data pre-processing.	Visual studio code, Anaconda navigator, TensorFlow
2.	Security Implementations	It identifies the gesture only when the hand is in front of the camera.	OpenCV
3.	Scalable Architecture	It can be used in any environment and is able to identify the gesture	OpenCV
4.	Availability	It is used to reduce the possibility of spreading infections	AI
5.	Performance	Rapid response to the gesture.	CNN

5.3 User Stories

User Type	Functional Requirement(Epic)	User Story Number	User Story / Task	Acceptance criteria	Priority	Release
Customer	Login	USN-1	Entering Webpage	Enter the application	High	Sprint 1
	Homepage	USN-2	Entering to the "Homepage" of theUI(Webpage)	Enter the homepage	High	Sprint 1
	About	USN-3	I can click on the "About" to details about theApplication	Get the details about theapplication	Low	Sprint 2
	Begin	USN-4	As a user I can upload my radiology imagefrom the computer.	Choose any imagefrom my device	High	Sprint 2
	Predict	USN-5	As a user I can turn on the camera usingpredictbutton	Turn on the camera forprediction	High	Sprint 3
		USN-6	Predicting the images using Hand Gesture	Can resize, blur, and flip my image using my handgesture	High	Sprint 3
		USN-7	I can give a gesture of raised fist and itrecognizes	Can get my fixed resizedimage	High	Sprint 4
		USN-8	I can show my index finger	Can get a rectangularimage	High	Sprint 4
		USN-9	I can show my index finger, middle finger andringfinger at once	Can get my image blurred	High	Sprint 4

17

CHAPTER 6

PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirmingmy password.	5	High	TM – 1 TM – 4
Sprint-1	Login	USN-2	As a user, I will receive confirmation email onceI have registered for the application	5	High	TM – 2 TM – 3
Sprint-2	Dashboard	USN-3	As a user, I can register for the application through Facebook	10	Low	TM – 1 TM – 2
Sprint-1	Details about	USN-4	As a user, I can register for the application through Gmail	5	Medium	TM – 3 TM – 1
Sprint-1	Login and repeated usage	USN-5	As a user, I can log into the application by entering email & password	5	High	TM – 2 TM – 4
Sprint - 2	web page details	USN-6	As a user I must capture images of hand and upload it into the web portal.	10	High	TM – 1 TM – 3
Sprint - 3	Upload the image in the web application	USN-7	As a user I must receive a correct hand gesture as output	20	High	TM – 1 TM – 2
Sprint - 4	Provide efficient customer support	USN-8	As a user, I need to get support from developers in case of queries and failure of service provided	10	Medium	TM – 3 TM –4
Sprint - 4	Overview the entire process. Take all the responsibility and act bridge between users and developers	USN-9	We need to satisfy the customer needs in an efficient way and make sure any sort of errors are fixed	10	High	TM – 2 TM – 1

6.2 Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

Velocity:

Imagine we have a 10-day sprint duration, and the velocity of the team is 20 (points per sprint). Let's calculate the team's average velocity (AV) per iteration unit (story points per day)

$$AV = \frac{sprint\ duration}{velocity} = \frac{20}{10} = 2$$

AV = sprint duration / velocity = 20/6 = 3.33

Burn down Chart:

A burn down chart is a graphical representation of work left to do versus time. It is often used in agile software development methodologies suchas Scrum. However, burn down charts can be applied to any project containing measurable progress over time.

Burndown Chart

CHAPTER 7

<body>
  <h1>INTRODUCTION</h1>
<h1>
  <span> Hand Gesture </span> <span> recognition system </span> <span> provides us </span
> <span> an innovative,</span> <span>natural,</span> <span> user friendly </span> <span>
way of interaction </span > <span> with the computer</span>
  <span> which is more </span> <span> familiar to the </span> <span>human beings. </span >
<span> In our project, </span> <span> the hand region </span> <span> is extracted from
</span> <span> the background </span > <span> by using</span>
<span> Region of intrest. </span> <span> Then, </span> <span> we will be </span >
<span>predicting the labels </span> <span> based on the </span> <span> CNN trained model
weights  </span> <span> of hand gestures </span > <span> using that predicted labels</span>
<span> we apply if conditions </span> <span> to control some of the actions </span>
<span>like </span > <span>reshaping , blur, flip of the given image.</span>
```

CHAPTER 8

TESTING
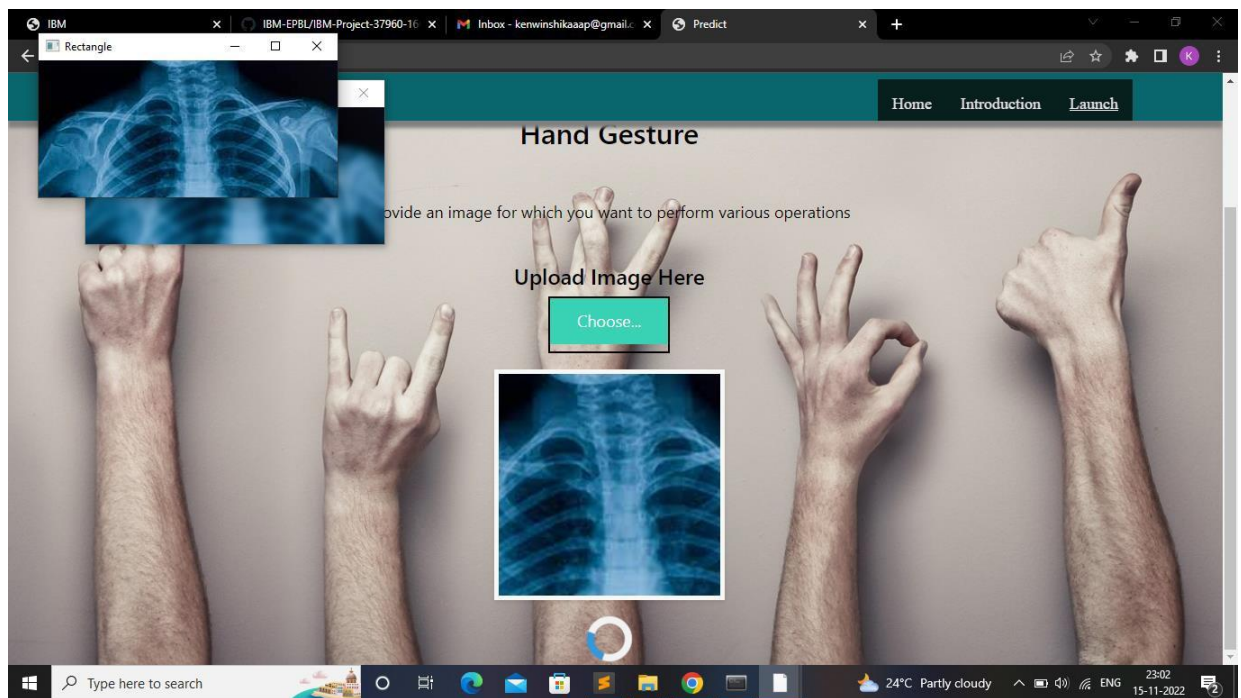

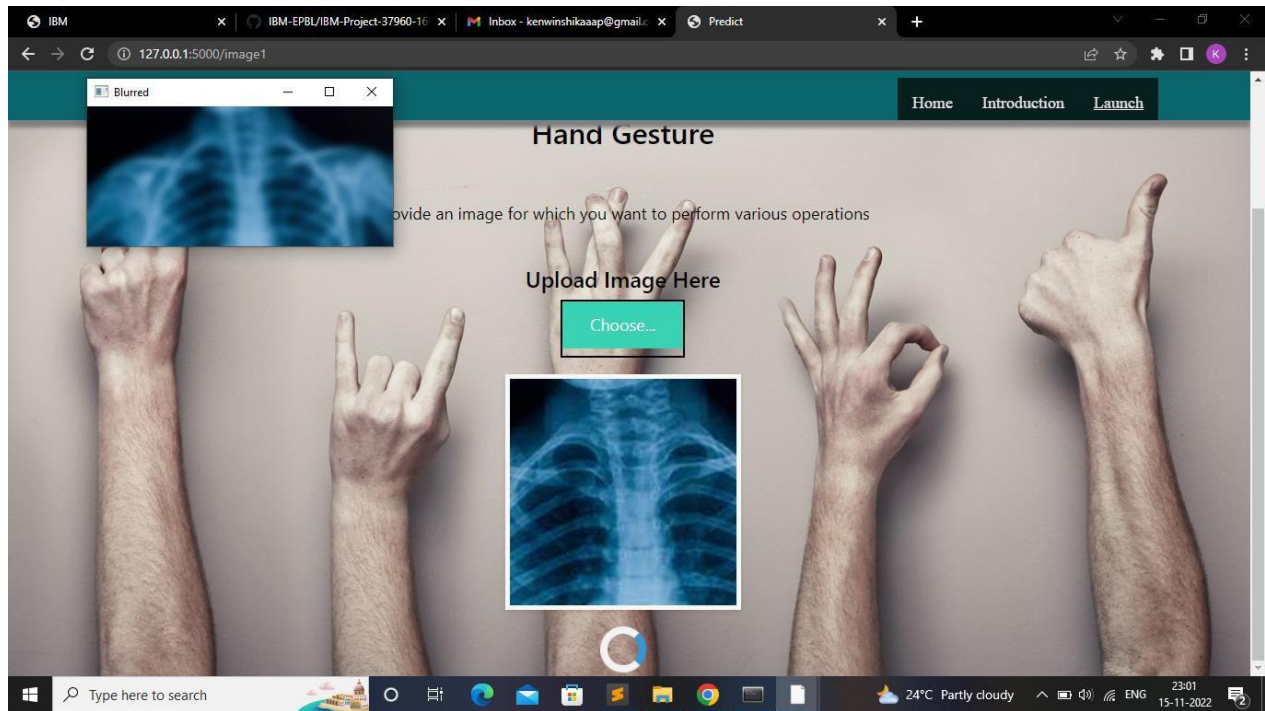

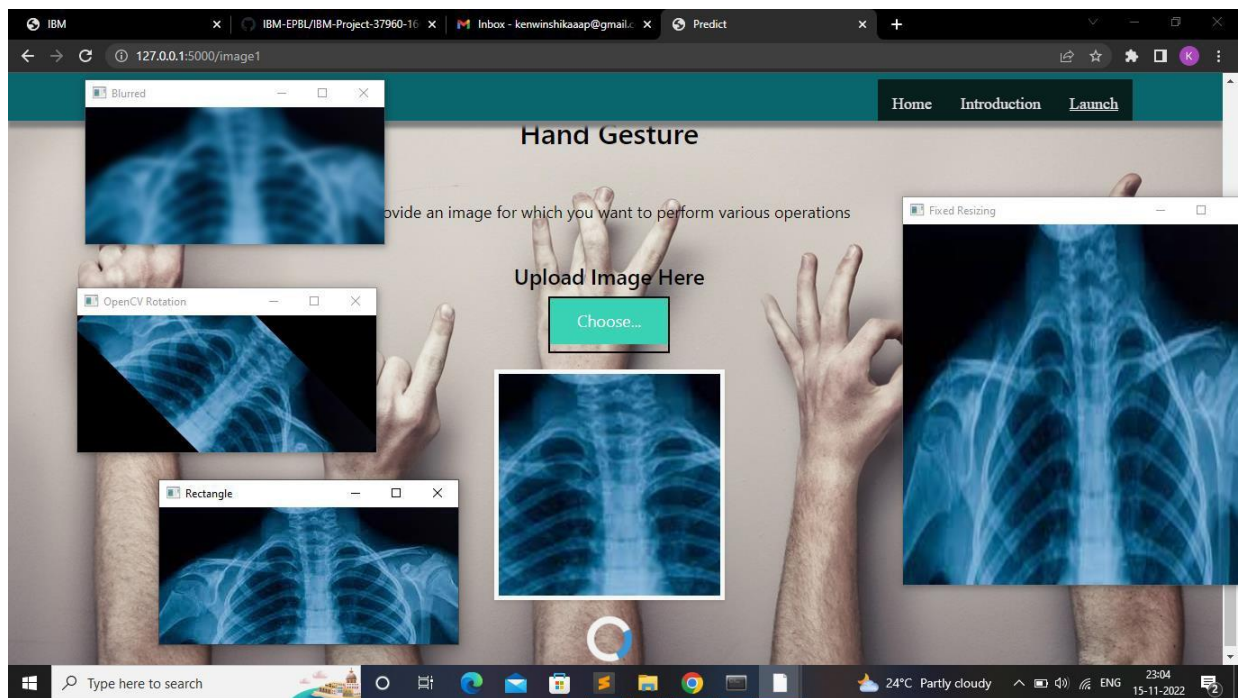

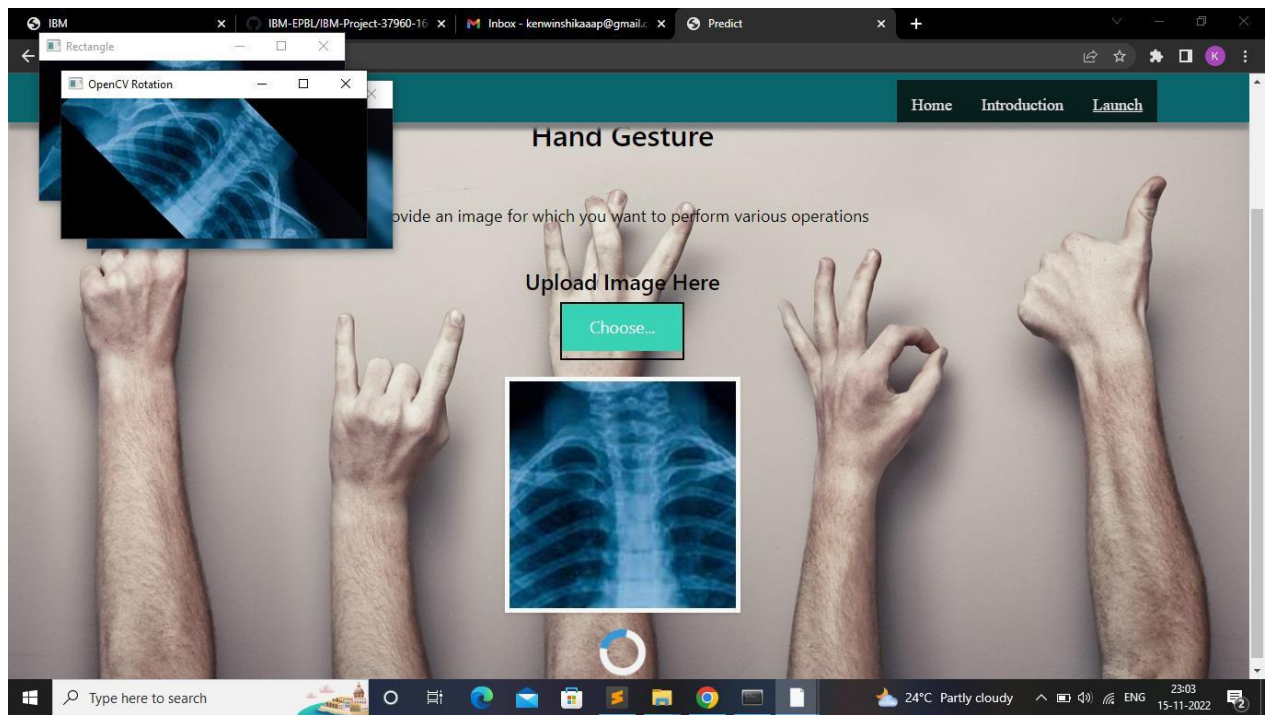

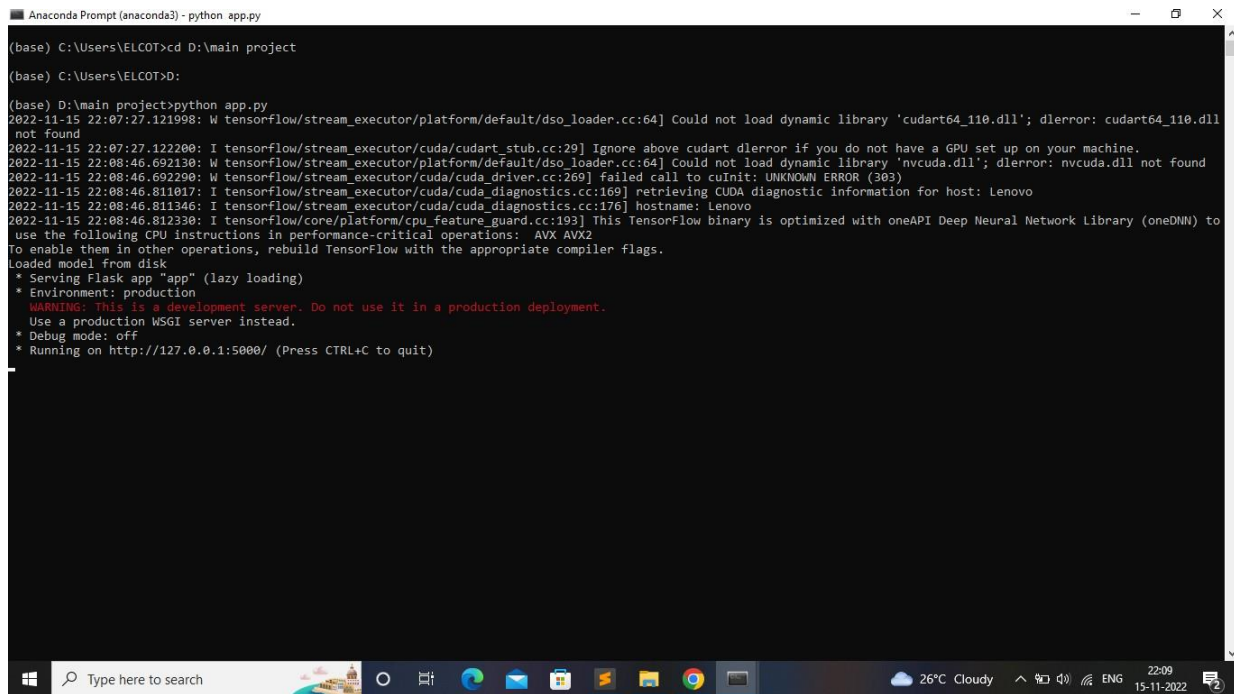

CHAPTER 9

RESULTS

In this project, we found that we can maintain the sterility of an operation theater, etc by using hand based gesture tools to browse the images obtained.

Final findings (Output) of the project along with screenshots as follows.

INTRODUCTION

Hand Gesture recognition system provides us an innovative, natural, user friendly
way of interaction with the computer which is more familiar to the human beings. In our project,
the hand region is extracted from the background by using Region of intrest. Then, we will be
predicting the labels based on the CNN trained model weights of hand gestures
using that predicted labels we apply if conditions to control some of the actions like
reshaping , blur, flip of the given image.
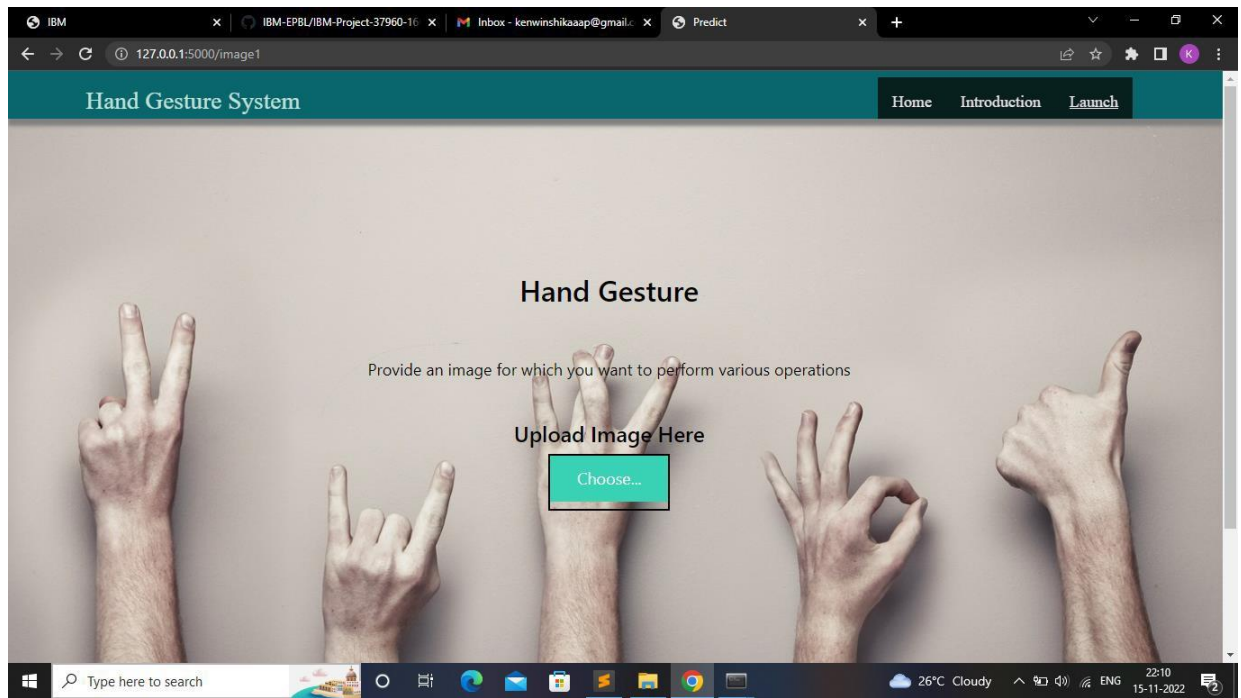

CHAPTER 10

ADVANTAGES & DISADVANTAGES

Advantages:

- Major advantage of this tool is that it helps to maintain the sterility of the environment.
- It is also easy to use and is quicker than the existing methods to browse images.
- It can also be performed even if the surgeon is a bit far away from the system, this helps to save time.
- The tool does not need the person using it to have an apparatus or any devices on them to use it.
- They can simply move their hands to browse through the images.

Disadvantages:

- The tool can be quite expensive as it requires cameras and other expensive devices to capture images and process it.

CHAPTER 11

CONCLUSION

In this project we developed a tool which recognizes the hand gestures and enables doctors to browse through radiology images using these gestures. This enables doctors and surgeons to maintain the sterility as they would not have to touch any mouse or keyboard to go through the images. This tool is also easy to use and is quicker than the regular method of using mouse/keyboard. It can be used regardless of the users location since they don't have to be in contact with any device. It also does not require the user to have any device on them to use it. Further this technology can be extended to other industries like it can be used by presenters, by teachers for show images in the classroom, etc.

CHAPTER 12

FUTURE SCOPE

- The tool can be made quicker by increasing the recognition speed.
- More number of gestures can be added thereby increasing this tool's functionality and use ability for different purposes.
- Tracking of both hands can be added to increase the set of commands.
- Voice commands can also be added to further increase the functionality.
